

# 10th CLASS MATH

## CHAPTER 7

### SOLUTION NOTES

#### Exercise 7.1

Q.1: Locate the following angles:

i.  $30^\circ$

ii.  $22\frac{1}{2}^\circ$

iii.  $135^\circ$

iv.  $-225^\circ$

v.  $-60^\circ$

vi.  $-120^\circ$

vii.  $-150^\circ$

viii.  $-225^\circ$ **Q.2:**

Express the following sexagesimal measures of angles in decimal form.

i.  $45^\circ 30'$ 

Solution:

$$\begin{aligned}
 &= 45^\circ + \frac{30'}{60'} \\
 &= 45^\circ + 0.5^\circ \\
 &= 45.5^\circ
 \end{aligned}$$

ii.  $60^\circ 30' 30''$ 

Solution:

$$\begin{aligned}
 &= 60^\circ + \frac{30'}{60'} + \frac{30''}{60' \times 60''} \\
 &= 60^\circ + 0.5^\circ + 0.008^\circ \\
 &= 60.508^\circ
 \end{aligned}$$

iii.  $125^\circ 22' 50''$ 

Solution:

$$\begin{aligned}
 &= 125^\circ + \frac{22'}{60'} + \frac{50''}{60' \times 60''} \\
 &= 125^\circ + 0.367^\circ + 0.0139^\circ \\
 &= 125.3808^\circ
 \end{aligned}$$

**Q.3:** Express the following in  $D^\circ M' S''$ :i.  $47.36^\circ$ 

Solution:

$$\begin{aligned}
 &= 47^\circ + 0.36^\circ \\
 &= 47^\circ + (0.36 \times 60)' \\
 &= 47^\circ + 21' + (0.6 \times 60)'' \\
 &= 47^\circ + 21' + 36'' \\
 &= 47^\circ 21' 36''
 \end{aligned}$$

ii.  $125.45^\circ$ 

Solution:

$$\begin{aligned}
 &= 125^\circ + 0.45^\circ \\
 &= 125^\circ + (0.45 \times 60)' \\
 &= 125^\circ + 27' \\
 &= 125^\circ 27' 0''
 \end{aligned}$$

iii.  $225.75^\circ$ 

Solution:

$$\begin{aligned}
 &= 225^\circ + 0.75^\circ \\
 &= 225^\circ + (0.75 \times 60)' \\
 &= 225^\circ + 45' \\
 &= 225^\circ 45' 0''
 \end{aligned}$$

iv.  $-22.5^\circ$ 

Solution:

$$\begin{aligned}
 &= -[22^\circ + 0.5^\circ] \\
 &= -[22^\circ + (0.5 \times 60)'] \\
 &= -[22^\circ + 30'] \\
 &= -22^\circ 30'
 \end{aligned}$$

v.  $-67.58^\circ$ 

Solution:

$$\begin{aligned}
 &= -(67^\circ + 0.58^\circ) \\
 &= -[67^\circ + (0.58 \times 60)'] \\
 &= -[67^\circ + 34' + 0.8'] \\
 &= [67^\circ + 34' + (0.8 \times 60)'] \\
 &= -[67^\circ + 34' + 48''] \\
 &= -67^\circ 34' 48''
 \end{aligned}$$

vi.  $315.18^\circ$ 

$$\begin{aligned}
 &= 315^\circ + 0.18^\circ \\
 &= 315^\circ + (0.18 \times 60)' \\
 &= 315^\circ + 10.8' \\
 &= 315^\circ + 10' + (0.8 \times 60)'' \\
 &= 315^\circ + 10' + 48'' \\
 &= 315^\circ 10' 48''
 \end{aligned}$$

**Q.4:** Express the following angles into radians.i.  $30^\circ$ 

$$\begin{aligned}
 &= 30 \frac{\pi}{180} \text{ radians} \\
 &= 30 \frac{\pi}{30 \times 6} \text{ radians} \\
 &= \frac{\pi}{6} \text{ radians}
 \end{aligned}$$

ii.  $60^\circ$ 

$$\begin{aligned}
 &= 60 \times \frac{\pi}{180} \text{ radian} \\
 &= 60 \frac{\pi}{60 \times 3} \text{ radian} \\
 &= \frac{\pi}{3} \text{ radians}
 \end{aligned}$$

iii.  $135^\circ$ 

Solution:

$$\begin{aligned}
 &= 135 \frac{\pi}{180} \text{ radians} \\
 &= 45 \times 3 \frac{\pi}{45 \times 4} \text{ radians} \\
 &= \frac{3\pi}{4} \text{ radians}
 \end{aligned}$$

iv.  $225^\circ$ Solution:  $225^\circ$ 

$$\begin{aligned}
 &= 225 \frac{\pi}{180} \text{ radians} \\
 &= 45 \times 5 \frac{\pi}{45 \times 4} \text{ radians} \\
 &= \frac{5\pi}{4} \text{ radians}
 \end{aligned}$$

v.  $-150^\circ$ 

Solution:

$$-150^\circ$$

$$\begin{aligned}
 &= -150 \frac{\pi}{180} \text{ radians} \\
 &= -5 \times 30 \frac{\pi}{30 \times 6} \text{ radians} \\
 &= -\frac{5\pi}{6} \text{ radians}
 \end{aligned}$$

vi.  $-225^\circ$

Solution:

$$\begin{aligned}
 &= -225 \frac{\pi}{180} \text{ radians} \\
 &= -5 \times 45 \frac{\pi}{45 \times 4} \text{ radians} \\
 &= -\frac{5\pi}{4} \text{ radians}
 \end{aligned}$$

vii.  $300^\circ$

Solution:

$$\begin{aligned}
 &= 300 \frac{\pi}{180} \text{ radians} \\
 &= 60 \times 5 \frac{\pi}{60 \times 3} \text{ radians} \\
 &= \frac{5\pi}{3} \text{ radians}
 \end{aligned}$$

viii.  $315^\circ$

Solution:

$$\begin{aligned}
 &= 315 \frac{\pi}{180} \text{ radians} \\
 &= 45 \times 7 \frac{\pi}{45 \times 4} \text{ radians} \\
 &= \frac{7\pi}{4} \text{ radians}
 \end{aligned}$$

**Q.5: Convert each of the following to degrees.**

i.  $\frac{3\pi}{4}$

Solution:

$$\begin{aligned}
 &\frac{3\pi}{4} \text{ radians} \\
 &= \frac{3\pi}{4} \frac{180}{\pi} \text{ degree} \\
 &= \frac{3\pi}{4} \frac{180}{\pi} \text{ degree} \\
 &= 3 \times 45 \text{ degrees} \\
 &= 135^\circ
 \end{aligned}$$

ii.  $\frac{5\pi}{6}$

Solution:

$$\begin{aligned}
 &\frac{5\pi}{6} \text{ radians} \\
 &= \frac{5\pi}{6} \frac{180}{\pi} \text{ degree} \\
 &= \frac{5\pi}{6} \frac{180}{\pi} \text{ degree} \\
 &= 5 \times 30 \text{ degrees} \\
 &= 150^\circ
 \end{aligned}$$

iii.  $\frac{7\pi}{8}$

Solution:

$$\begin{aligned}
 &\frac{7\pi}{8} \text{ radians} \\
 &= \frac{7\pi}{8} \frac{180}{\pi} \text{ degree}
 \end{aligned}$$

$$\begin{aligned}
 &= \frac{7 \times 180}{8} \text{ degree} \\
 &= \frac{1260}{8} \text{ degrees} \\
 &= 157.5^\circ
 \end{aligned}$$

iv.  $\frac{13\pi}{16}$

Solution:

$$\begin{aligned}
 &\frac{13\pi}{16} \text{ radians} \\
 &= \frac{13\pi}{16} \frac{180}{\pi} \text{ degree} \\
 &= \frac{13 \times 180}{16} \text{ degree} \\
 &= \frac{2340}{16} \text{ degrees} \\
 &= 146.25^\circ
 \end{aligned}$$

v.  $3 \text{ radians}$

Solution:

$$\begin{aligned}
 &3 \text{ radians} \\
 &= 3 \frac{180}{\pi} \text{ degree} \\
 &= \frac{540}{\pi} \text{ degrees} \\
 &= 171.887^\circ
 \end{aligned}$$

vi.  $4.5$

Solution:

$$\begin{aligned}
 &4.5 \text{ radians} \\
 &= 4.5 \frac{180}{\pi} \text{ degree} \\
 &= \frac{810}{\pi} \text{ degrees} \\
 &= 257.831^\circ
 \end{aligned}$$

vii.  $-\frac{7\pi}{8}$

Solution:

$$\begin{aligned}
 &-\frac{7\pi}{8} \text{ radians} \\
 &= -\frac{7\pi}{8} \frac{180}{\pi} \text{ degree} \\
 &= \frac{-1260}{8} \text{ degrees} \\
 &= 157.5^\circ
 \end{aligned}$$

viii.  $-\frac{13}{16}\pi$

Solution:

$$\begin{aligned}
 &-\frac{13\pi}{16} \text{ radians} \\
 &= -\frac{13\pi}{16} \frac{180}{\pi} \text{ degree} \\
 &= \frac{-2340}{16} \text{ degrees} \\
 &= 146.25^\circ
 \end{aligned}$$

## Exercise 7.2

Question No.1 Find  $\theta$  when :

i.  $I = 2\text{cm}, r = 3.5\text{cm}$

Solution: using rule

$$\begin{aligned} I &= r\theta \\ 2 &= 3.5\theta \\ \frac{2}{3.5} &= \theta \\ \theta &= 0.57 \text{ radian} \end{aligned}$$

ii.  $I = 4.5\text{m}, r = 2.5\text{m}$

Solution: using rule

$$I = r\theta$$

$$\frac{I}{r} = \theta$$

$$\frac{4.5}{2.5} = \theta$$

$$\theta = 1.8 \text{ radian}$$

Question No.2 find  $I$  when

i.  $\theta = 180^\circ, r = 4.9\text{cm}$

Solution:

As  $\theta$  should be in radian so

$$\begin{aligned} \theta &= 180^\circ \\ &= 180 \frac{\pi}{180} \text{ radian} \\ &= \pi \text{ radian} \end{aligned}$$

Using rule  $I = r\theta$

$$\begin{aligned} &= 4.9\text{cm} \times \pi \\ &= 15.4\text{cm} \end{aligned}$$

ii.  $\theta = 60^\circ 30', r = 15\text{mm}$

Solution:

As  $\theta$  should be in radian, so

$$\begin{aligned} \theta &= 60^\circ 30' \\ &= 60^\circ + \frac{30'}{60} \\ &= 60.5^\circ \\ &= 60.5 \frac{\pi}{180} \text{ radian} \\ \theta &= 1.056 \text{ radian} \\ \theta &= 1.056 \text{ radian} \\ \text{using rule } I &= r\theta \\ &= 15\text{mm} \times 1.056 \\ &= 15.84\text{mm} \end{aligned}$$

Questions No.3 find  $r$ , when

i.  $I = 4\text{cm}, \theta = \frac{1}{4} \text{ radian}$

Solution:

Using Rule  $I = r\theta$

$$4\text{cm} = r \frac{1}{4}$$

$$4\text{cm} \times 4 = r$$

$$r = 16\text{cm}$$

ii.  $I = 52\text{cm}, \theta = 45^\circ$

Solution: As  $\theta$  should be in radians.

$$\begin{aligned} \theta &= 45^\circ \\ &= 45 \frac{\pi}{180} \text{ radian} \end{aligned}$$

$$= \frac{\pi}{4} \text{radian}$$

Now using rule  $I = r\theta$

$$52\text{cm} = r \frac{\pi}{4}$$

$$\frac{52\text{cm} \times 4}{\pi} = r$$

$$r = 66.21 \text{ cm}$$

**Question No.4** In a circle of radius 12cm, find the length of an arc which subtends a

**Central angle  $\theta = 1.5 \text{ radian}$**

**Solution:**

$$\text{Radius} = r = 12\text{cm}$$

$$\text{Arc length} = ?$$

$$\text{Central angle} = \theta = 1.5 \text{ radian}$$

Using rule  $I = r\theta$

$$I = 12\text{m} \times 1.5$$

$$I = 18\text{m}$$

**Question No.5** In a circle of radius 10m, find the distance travelled by a point moving on this circle if the point makes 3.5 revolution.

**Solution:**

$$\text{Radius} = r = 10\text{m}$$

$$\text{Number of revolutions} = 3.5$$

$$\text{Angle of one revolution} = 2\pi$$

$$\text{Angle of 3.5 revolution} = \theta$$

$$= 3.5 \times 2\pi \text{radian}$$

$$\theta = 7\pi \text{ radian}$$

$$\text{Distance travelled} = I = ?$$

$$\text{Using rule } I = r\theta$$

$$I = 10\text{m} \times 7\pi$$

$$I = 220\text{m}$$

**Question No.6** What is the circular measure of the angle between the hands of the watch at 3 O' clock?

**Solution:**

At 3 O' clock the minute hand will be at 12 and hour hand will be at 3 i.e the angle between the hands of watch will be one quarter of the central angle of full circle.

$$i.e = \frac{1}{4} \text{ of } 360^\circ$$

$$\frac{1}{4} \times 360^\circ$$

$$= 90^\circ$$

$$= 90 \frac{\pi}{180} \text{radian}$$

$$= \frac{\pi}{2} \text{radian}$$

**Question No.7** What is the length of arc APB?

**Solution:**

From the figure we see that

$$\text{Radius} = r = 8\text{cm}$$

$$\text{Central angle} = \theta$$

$$= 90^\circ$$

$$= \frac{\pi}{2} \text{radian}$$

$$\text{Arc length } I = ?$$

$$\text{By rule } I = r\theta$$

$$I = 8\text{cm} \times \frac{\pi}{2}$$

$$I = 4\text{cm} \times \pi$$

$$I = 12.57 \text{ cm}$$

So, length of arc APB is 12.57 cm

**Question No.8** In a circle 12cm, how long an arc subtended a central angle of  $84^\circ$ ?

**Solution:**

$$\text{Radius} = r = 12\text{cm}$$

$$\text{Arc length} = I = ?$$

$$\text{Central angle} = \theta = 84^\circ$$

$$= 84 \frac{\pi}{180} \text{radian}$$

$$= 1.466 \text{ radian}$$

Now by rule  $I = r\theta$

$$12\text{cm} \times 1.466 \\ = 17.6\text{ cm}$$

**Question No.9 Find the area of sector OPR**

Radius =  $r = 6\text{cm}$

Central angle =  $\theta = 60^\circ$

$$= 60 \frac{\pi}{180} \text{radian} \\ = \frac{\pi}{3} \text{radian}$$

Area of sector = ?

As area of sector =  $\frac{1}{2}r^2\theta$

$$= \frac{1}{2} \times (6\text{cm})^2 \times \frac{\pi}{3} \\ = \frac{1}{6} \times 36\text{cm}^2 \times \pi \\ = 6\pi\text{ cm}^2 \\ = 18.85\text{cm}^2$$

(b)

Radius =  $r = 20\text{cm}$

Central angle =  $\theta = 45^\circ$

$$= 45 \frac{\pi}{180} \text{radian} \\ = \frac{\pi}{4} \text{radian}$$

Area of sector = ?

Area of Sector =  $\frac{1}{2}r^2\theta$

$$= \frac{1}{2}(20\text{cm})^2 \times \frac{\pi}{4} \\ = \frac{400\text{cm}^2}{8} \times \pi \\ = 50\pi\text{cm}^2 \\ = 157.1\text{ cm}^2$$

**Question No.10 Find area of sector inside a central angle of  $20^\circ$  in a circle of radius  $7\text{m}$ .**

**Solution:**

Area of sector = ?

Radius =  $r = 7\text{m}$

Central angle =  $\theta = 20^\circ$

$$= 20 \frac{\pi}{180} \text{radian} \\ = \frac{\pi}{9} \text{radian}$$

$$\text{Area of sector} = \frac{1}{2}r^2\theta \\ = \frac{1}{2} \times (7\text{m})^2 \times \frac{\pi}{9} \\ = \frac{49\pi}{18} \text{m}^2 \\ = 8.55\text{m}^2$$

**Question No.11 Sehar is making skirt. Each panel of this skirt is of the shape shown shaded in the diagram. How much material (cloth) is required for each panel?**

**Solution:**

Central angle =  $\theta = 80^\circ$

$$= 80 \frac{\pi}{180} \text{radian} \\ = \frac{4\pi}{9} \text{radian}$$

Radius of bigger sector =  $R = (65 + 10)\text{cm}$

$R = 66\text{cm}$

Radius of smaller sector =  $r = 10\text{cm}$

Shaded area = ?

$$\text{Area of bigger sector} = \frac{1}{2}R^2\theta \\ = \frac{1}{2} \times (66\text{cm})^2 \times \frac{4\pi}{9}$$

$$= 4356\text{cm}^2 \times \frac{2\pi}{9}$$

$$968\pi\text{cm}^2$$

$$\text{Area of smaller sector} = \frac{1}{2} r^2 \theta$$

$$= \frac{1}{2} r^2 \theta$$

$$= \frac{1}{2} (10\text{cm})^2 \times \frac{4\pi}{9}$$

$$= \frac{200}{9} \pi\text{cm}^2$$

$$\text{Shaded area } 968\pi - \frac{200}{9}\pi$$

$$= \frac{8712\pi - 200\pi}{9}$$

$$= \frac{8512}{9} \pi\text{cm}^2$$

$$= 2971.25\text{cm}^2$$

**Question No.12** Find the area of a sector with central angle of  $\frac{\pi}{5}$  radian in a circle of radius 10cm.

**Solution:**

Area of sector = ?

$$\text{Central angle} = \theta = \frac{\pi}{5} \text{ radian}$$

$$\text{Radius} = r = 10\text{cm}$$

$$\text{Area of sector} = \frac{1}{2} r^2 \theta$$

$$= \frac{1}{2} (10\text{cm})^2 \times \frac{\pi}{5}$$

$$= \frac{1}{10} \times 100\text{cm}^2 \times \pi$$

$$= \frac{1}{10} \times 100\text{cm}^2 \times \pi$$

$$= 10\pi\text{cm}^2$$

$$= 31.43 \text{ cm}^2$$

**Question No.13** The area of sector with central angle  $\theta$  in circle of radius 2m is 10 square meter. Find  $\theta$  in radius

**Solution:**

$$\text{Area of sector} = 10\text{m}^2$$

$$\text{Radius} = r = 2\text{m}$$

$$\text{Central angle} = \theta = ?$$

$$\text{As area of sector} = \frac{1}{2} r^2 \theta$$

$$10\text{m}^2 = \frac{1}{2} (2\text{m})^2 \theta$$

$$10\text{m}^2 = \frac{1}{2} (4\text{m}^2) \theta$$

$$10\text{m}^2 = 2\text{m}^2 \theta$$

$$\theta = \frac{10\text{m}^2}{2\text{m}^2}$$

$$\theta = 5 \text{ radian}$$

### Exercise 7.3

**Question No.1** Locate each of the following angles in standard position using a protector or fair free hand guess, also find a positive and a negative angle coterminal with each given angle:

**Solution:**

i.  $170^\circ$

$$\text{Positive coterminal angle} = 360^\circ + 170^\circ = 530^\circ$$

$$\text{Negative coterminal angle} = -190^\circ$$

ii.  $780^\circ$

$$\text{Positive coterminal angle } 780^\circ + 2[360^\circ] = 60^\circ$$

$$\text{Negative coterminal angle} = -300^\circ$$

iii.  $-100^\circ$

$$\text{Positive coterminal angle } 260^\circ$$

$$\text{Negative coterminal angle} = -360^\circ - 100^\circ = -460^\circ$$

iv.  $-500^\circ$

$$\text{Positive coterminal angle} = 220^\circ$$

$$\text{Negative coterminal angle} = -140^\circ$$

**Question No.2** Identify closest quadrant angles between which the following angles lie.

i.  $156^\circ$

Answer:  $90^\circ$  and  $180^\circ$

ii.  $318^\circ$

Answer:  $270^\circ$  and  $360^\circ$

iii.  $572^\circ$

Answer:  $540^\circ$  and  $630^\circ$

iv.  $-330^\circ$

Answer:  $0^\circ$  and  $90^\circ$

**Question No.3** Write the closest quadrantal angles between which the angles lie. Write your answer in radian measure.

i.  $\frac{\pi}{3}$

Answer:  $0$  and  $\frac{\pi}{2}$

ii.  $\frac{3\pi}{4}$

Answer:  $\frac{\pi}{2}$  and  $\pi$

iii.  $-\frac{\pi}{2}$

Answer:  $0$  and  $-\frac{\pi}{2}$

iv.  $-\frac{3\pi}{4}$

Answer:  $-\frac{\pi}{2}$  and  $-\pi$

**Question No.4** in which quadrant  $\theta$  lies, when

i.  $\sin\theta > 0, \tan\theta < 0$

Answer: II quadrant

ii.  $\cos\theta < 0, \sin\theta < 0$

Answer: III quadrant

iii.  $\sec\theta > 0, \sin\theta < 0$

Answer: IV quadrant

iv.  $\cot\theta < 0, \tan\theta < 0$

Answer: II quadrant

v.  $\csc\theta > 0, \cos\theta > 0$

Answer: I quadrant

vi.  $\sin\theta < 0, \sec\theta < 0$

Answer: III quadrant

**Question No.5 Fill in the blanks:**

- i.  $\cos(-150^\circ) = \underline{\hspace{2cm}} \cos 150^\circ$   
 ii.  $\sin(-310^\circ) = \underline{\hspace{2cm}} \sin 310^\circ$   
 iii.  $\tan(-210^\circ) = \underline{\hspace{2cm}} \tan 210^\circ$   
 iv.  $\cot(-45^\circ) = \underline{\hspace{2cm}} \cot 45^\circ$   
 v.  $\sec(-60^\circ) = \underline{\hspace{2cm}} \sec 60^\circ$   
 vi.  $\operatorname{cosec}(-137^\circ) = \underline{\hspace{2cm}} \operatorname{cosec} 137^\circ$

**Answers:**

- i. +ve    ii. -ve    iii. -ve  
 iv. -ve    v. +ve    vi. -ve

**Question No.6 The given point p lies on the terminal side of  $\theta$ , Find quadrant of  $\theta$  and all six trigonometric ratios.**

- i.  $(-2, 3)$

we have  $x = -2$  and  $y = 3$ , so  $\theta$  lies in quadrant II.

$$\begin{aligned} r &= \sqrt{x^2 + y^2} \\ &= \sqrt{(-2)^2 + (3)^2} \\ &= \sqrt{4 + 9} \\ &= \sqrt{13} \end{aligned}$$

Thus,

$$\begin{array}{l|l} \sin \theta = \frac{y}{r} = \frac{3}{\sqrt{13}} & \operatorname{cosec} \theta = \frac{\sqrt{13}}{3} \\ \cos \theta = \frac{x}{r} = -\frac{2}{\sqrt{13}} & \sec \theta = -\frac{\sqrt{13}}{2} \\ \tan \theta = \frac{y}{x} = -\frac{3}{2} & \cot \theta = -\frac{2}{3} \end{array}$$

- ii.  $(-3, 4)$

we have  $x = -3$  and  $y = 4$ , so  $\theta$  lies in quadrant III.

$$\begin{aligned} r &= \sqrt{x^2 + y^2} \\ &= \sqrt{(-3)^2 + (4)^2} \\ &= \sqrt{9 + 16} \\ &= \sqrt{25} \\ &= 5 \end{aligned}$$

Thus,

$$\begin{array}{l|l} \sin \theta = \frac{y}{r} = \frac{-4}{5} & \operatorname{cosec} \theta = \frac{-5}{4} \\ \cos \theta = \frac{x}{r} = \frac{-3}{5} & \sec \theta = -\frac{5}{3} \\ \tan \theta = \frac{y}{x} = \frac{4}{3} & \cot \theta = \frac{3}{4} \end{array}$$

- iii.  $(\sqrt{2}, 1)$

We have  $x = \sqrt{2}$  and  $y = 1$  so  $\theta$  lies in quadrant I.

$$\begin{aligned} r &= \sqrt{x^2 + y^2} \\ &= \sqrt{(\sqrt{2})^2 + (1)^2} \\ &= \sqrt{2 + 1} \\ &= \sqrt{3} \end{aligned}$$

Thus,

$$\begin{array}{l|l} \sin \theta = \frac{y}{r} = \frac{1}{\sqrt{3}} & \operatorname{cosec} \theta = \sqrt{3} \\ \cos \theta = \frac{x}{r} = \frac{\sqrt{2}}{\sqrt{3}} & \sec \theta = \frac{\sqrt{3}}{\sqrt{2}} \\ \tan \theta = \frac{y}{x} = \frac{1}{\sqrt{2}} & \cot \theta = \sqrt{2} \end{array}$$

**Question No.7 if  $\cos \theta = -\frac{2}{3}$  and terminal arm of the angle  $\theta$  is in quadrant II, find the values of remaining trigonometric functions.**

In any right triangles XYZ

$$\cos \theta = -\frac{2}{3} = \frac{x}{r} \text{ then } x = -2 \text{ and } r = 3$$

Also,

$$\sec \theta = \frac{1}{\cos \theta} = -\frac{3}{2}$$

As we know

$$\begin{aligned} r^2 &= x^2 + y^2 \\ (3)^2 &= (-2)^2 + y^2 \\ 9 &= 4 + y^2 \\ y^2 &= 5 \\ y &= \pm\sqrt{5} \text{ so } y = \sqrt{5} \end{aligned}$$

Now

$$\begin{array}{l|l} \sin \theta = \frac{y}{r} = \frac{\sqrt{5}}{3} & \operatorname{cosec} \theta = \frac{r}{y} = \frac{3}{\sqrt{5}} \\ \cos \theta = \frac{x}{r} = \frac{-2}{3} & \sec \theta = \frac{r}{x} = \frac{-3}{2} \\ \tan \theta = \frac{y}{x} = \frac{-\sqrt{5}}{2} & \cot \theta = \frac{-2}{\sqrt{5}} \end{array}$$

**Question No.8 if  $\tan \theta = \frac{4}{3}$  and  $\sin \theta < 0$ , find the values of other trigonometric functions at  $\theta$** 

**Solution:**

As  $\tan \theta = \frac{4}{3}$  and  $\sin \theta$  is -ve, which is possible in quadrant III only. We complete the figure.

From the figure  $x = -3$  and  $y = -4$

By Pythagorean theorem

$$\begin{aligned} r^2 &= x^2 + y^2 \\ r &= \sqrt{x^2 + y^2} \\ r &= \sqrt{(-3)^2 + (-4)^2} \\ r &= \sqrt{9 + 16} \\ r &= \sqrt{25} \\ r &= 5 \end{aligned}$$

Now,

$$\begin{array}{l|l} \sin\theta = \frac{y}{r} = -\frac{4}{5} & \operatorname{cosec}\theta = \frac{r}{y} = -\frac{5}{4} \\ \cos\theta = \frac{x}{r} = -\frac{3}{5} & \sec\theta = \frac{r}{x} = -\frac{5}{3} \\ \tan\theta = \frac{y}{x} = \frac{4}{3} & \cot\theta = \frac{3}{4} \end{array}$$

**Question No. 9** if  $\sin\theta = -\frac{1}{\sqrt{2}}$ , and terminal side of the angle is not in quadrant III, find the values of  $\tan\theta$ ,  $\sec\theta$  and  $\operatorname{cosec}\theta$ .

**Solution:**

As  $\sin = -\frac{1}{\sqrt{2}}$  and terminal side of angle is not in III quadrant, so it lies in quadrant IV.

From the figure  $y = -1$  and  $r = \sqrt{2}$

By Pythagorean theorem

$$\begin{aligned} r^2 &= x^2 + y^2 \\ x^2 &= r^2 - y^2 \\ x &= \sqrt{r^2 - y^2} \\ r &= \sqrt{(\sqrt{2})^2 - (-1)^2} \\ r &= \sqrt{2 - 1} \\ r &= \sqrt{1} \\ r &= 1 \end{aligned}$$

Now,

$$\begin{aligned} \tan\theta &= \frac{y}{x} = -\frac{1}{1} = -1 \\ \sec\theta &= \frac{r}{x} = \frac{\sqrt{2}}{1} = \sqrt{2} \\ \operatorname{cosec}\theta &= \frac{r}{y} = \frac{\sqrt{2}}{-1} = -\sqrt{2} \end{aligned}$$

**Question No.10** If  $\operatorname{cosec}\theta = \frac{13}{12}$  and  $\sec\theta > 0$  find

The remaining trigonometric functions.

**Solution:**

As,  $\operatorname{cosec}\theta = \frac{13}{12}$  and also  $\sec\theta$  is +ve, which is only possible in quadrant I

From the figure  $y = 12$  and  $r = 13$

By Pythagorean theorem

$$\begin{aligned} r^2 &= x^2 + y^2 \\ x^2 &= r^2 - y^2 \\ x &= \sqrt{r^2 - y^2} \\ r &= \sqrt{(13)^2 - (12)^2} \\ r &= \sqrt{169 - 144} \\ r &= \sqrt{25} \\ r &= 5 \end{aligned}$$

Now,

$$\begin{array}{l|l} \sin\theta = \frac{y}{r} = \frac{12}{13} & \operatorname{cosec}\theta = \frac{r}{y} = \frac{13}{12} \\ \cos\theta = \frac{x}{r} = \frac{5}{13} & \sec\theta = \frac{r}{x} = \frac{13}{5} \\ \tan\theta = \frac{y}{x} = \frac{12}{5} & \cot\theta = \frac{5}{12} \end{array}$$

**Question No.11** Find the values of trigonometric functions at the indicated angles  $\theta$  in the right triangles.

i.

From the figure Hypotenuse = 4 and Base = 3

By Pythagorean theorem we can find perpendicular.

$$(Perp.)^2 + (Base)^2 = (Hyp.)^2$$

$$(perp.)^2 + (3)^2 = (4)^2$$

$$(perp.)^2 = 16 - 9$$

$$(perp.)^2 = 7$$

$$perpendicular = \sqrt{7}$$

Now

$$\begin{array}{l|l} \sin\theta = \frac{Per.}{Hyp.} = \frac{\sqrt{7}}{4} & \operatorname{cosec}\theta = \frac{Hyp.}{Per.} = \frac{4}{\sqrt{7}} \\ \cos\theta = \frac{Base}{Hyp.} = \frac{3}{4} & \sec\theta = \frac{Hyp.}{Base} = \frac{4}{3} \\ \tan\theta = \frac{Per.}{Base} = \frac{\sqrt{7}}{3} & \cot\theta = \frac{Base}{Per.} = \frac{3}{\sqrt{7}} \end{array}$$

ii. From the figure

Hypotenuse = 17

Perpendicular = 8

Base = 15

Now

$$\begin{array}{l|l} \sin\theta = \frac{Per.}{Hyp.} = \frac{8}{17} & \operatorname{cosec}\theta = \frac{Hyp.}{Per.} = \frac{17}{8} \\ \cos\theta = \frac{Base}{Hyp.} = \frac{15}{17} & \sec\theta = \frac{Hyp.}{Base} = \frac{17}{15} \\ \tan\theta = \frac{Per.}{Base} = \frac{8}{15} & \cot\theta = \frac{Base}{Per.} = \frac{15}{8} \end{array}$$

iii. From the figure

hypotenuse = 7 Base = 3

we can find perpendicular by Pythagorean theorem.

$$(Base)^2 + (Perp.)^2 = (Hyp.)^2$$

$$(Perp.)^2 + (3)^2 = (7)^2$$

$$(perp.)^2 = 40 - 9$$

$$(perp.)^2 = 40$$

$$Perp. = \sqrt{40}$$

$$Perp. = \sqrt{4 \times 10}$$

Now.

$$\begin{array}{l|l} \sin\theta = \frac{Per.}{Hyp.} = \frac{2\sqrt{10}}{7} & \operatorname{cosec}\theta = \frac{Hyp.}{Per.} = \frac{7}{2\sqrt{10}} \\ \cos\theta = \frac{Base}{Hyp.} = \frac{3}{7} & \sec\theta = \frac{Hyp.}{Base} = \frac{7}{3} \\ \tan\theta = \frac{Per.}{Base} = \frac{2\sqrt{10}}{3} & \cot\theta = \frac{Base}{Per.} = \frac{3}{2\sqrt{10}} \end{array}$$

**Question No.12** Find the value of the trigonometric functions. Do not use trigonometric table or calculator.

**Solution:**

we know that  $2k\pi + \theta = \theta$ , where  $k \in \mathbb{Z}$

i.  $\tan 30^\circ$

$$30^\circ = 30 \frac{\pi}{180} \text{ radian} = \frac{\pi}{6} \text{ radian}$$

$$\tan 30^\circ = \tan \frac{\pi}{6} = \frac{1}{\sqrt{3}}$$

ii.  $\tan 330^\circ$

$$\tan 330^\circ = \tan(360^\circ - 30^\circ)$$

$$= \tan 2\pi - \frac{\pi}{6}$$

$$= \tan\left(-\frac{\pi}{6}\right)$$

$$= -\tan \frac{\pi}{6}$$

$$= -\frac{1}{\sqrt{3}}$$

iii.  $\sec 330^\circ$

$$\sec 330^\circ = \sec(360^\circ - 30^\circ)$$

$$= \sec 2\pi - \frac{\pi}{6}$$

$$= \sec - \frac{\pi}{6}$$

$$= \sec \frac{\pi}{6}$$

$$= \frac{2}{\sqrt{3}}$$

iv.  $\cot \frac{\pi}{4}$

$$= \frac{1}{\tan \frac{\pi}{4}}$$

$$= \frac{1}{\tan 45^\circ} = \frac{1}{1} = 1$$

v.  $\cos \frac{2\pi}{3}$

$$\cos(120^\circ) = -\frac{1}{2}$$

$$\begin{aligned} \text{vi. } \operatorname{cosec} \frac{2\pi}{3} \\ \operatorname{cosec} \frac{2\pi}{3} &= \operatorname{cosec} 120^\circ = \frac{1}{\sin(120^\circ)} = \frac{1}{\frac{\sqrt{3}}{2}} \\ &= \frac{2}{\sqrt{3}} \end{aligned}$$

$$\begin{aligned} \text{vii. } \cos(-450^\circ) \\ \cos(-450^\circ) &= \cos(-360^\circ - 90^\circ) \\ &= \cos - 2\pi - \frac{\pi}{2} \\ &= \cos 2(-1)\pi - \frac{\pi}{2} \\ &= \cos \frac{\pi}{2} = 0 \end{aligned}$$

$$\begin{aligned} \text{viii. } \tan(-9\pi) \\ \tan(-9\pi) &= \tan(-8\pi - \pi) \\ &= \tan[2(-4)\pi - \pi] \\ &= \tan(-8\pi + (-\pi)) \\ &= \tan(-\pi) \\ &= 0 \end{aligned}$$

$$\begin{aligned} \text{ix. } \cos\left(-\frac{5\pi}{6}\right) \\ &= \cos\left(-\frac{5\pi}{6}\right) \\ &= -\cos \frac{\pi}{6} = -\frac{\sqrt{3}}{2} \end{aligned}$$

$$\begin{aligned} \text{x. } \sin \frac{7\pi}{6} \\ \sin \frac{7\pi}{6} &= \sin\left(2\pi - \frac{5\pi}{6}\right) \\ &= \sin\left[2\pi + \left(-\frac{5\pi}{6}\right)\right] \\ &= \sin\left(-\frac{5\pi}{6}\right) = \sin(-150^\circ) = -\frac{1}{2} \end{aligned}$$

$$\begin{aligned} \text{xi. } \cot \frac{7\pi}{6} \\ \cot \frac{7\pi}{6} &= \cot\left[2\pi + \left(-\frac{5\pi}{6}\right)\right] \\ &= \cot\left(-\frac{5\pi}{6}\right) \\ &= \frac{1}{\tan\left(-\frac{5\pi}{6}\right)} = \frac{1}{\tan(-150^\circ)} = \frac{1}{-\frac{1}{\sqrt{3}}} = \sqrt{3} \end{aligned}$$

$$\begin{aligned} \text{xii. } \cos 225^\circ \\ \cos(225^\circ) &= \cos(180^\circ + 45^\circ) \\ &= \cos \pi + \frac{\pi}{4} \\ &= -\cos \frac{\pi}{4} = -\frac{1}{\sqrt{2}} \end{aligned}$$

## Exercise 7.4

Things to know:

$$\cos^2 \theta + \sin^2 \theta = 1$$

$$1 + \tan^2 \theta = \sec^2 \theta$$

$$1 + \cot^2 \theta = \operatorname{cosec}^2 \theta$$

In problem 1 – 6 simplify each expression to a single trigonometric functions.

$$1. \frac{\sin^2 x}{\cos^2 x}$$

Solution:

$$\therefore \frac{\sin^2 x}{\cos^2 x} = \tan^2 x$$

$$2. \tan x \sin x \sec x$$

Solution:

$$\begin{aligned} \tan x \sin x \sec x &= \tan x \sin x \left(\frac{1}{\cos x}\right) \\ &= \frac{\sin x}{\cos x} \sin x \frac{1}{\cos x} \\ &= \frac{\sin^2 x}{\cos^2 x} \\ &= \tan^2 x \end{aligned}$$

$$3. \frac{\tan x}{\sec x}$$

Solution:

$$\frac{\tan x}{\sec x} = \frac{\frac{\sin x}{\cos x}}{\frac{1}{\cos x}} = \frac{\sin x}{\cos x} \times \frac{\cos x}{1} = \sin x$$

$$4. 1 - \cos^2 x$$

Solution:

$$1 - \cos^2 x = \cos^2 x + \sin^2 x - \cos^2 x = \sin^2 x$$

$$5. \sec^2 x - 1$$

Solution:

$$\begin{aligned} \sec^2 x - 1 &= \sec^2 x - (\sec^2 - \tan^2 x) \\ &= \sec^2 x - \sec^2 x + \tan^2 x \\ &= \tan^2 x \end{aligned}$$

$$6. \sin^2 x \cdot \cot^2 x$$

Solution:

$$\begin{aligned} \sin^2 x \cdot \cot^2 x &= \sin^2 x \cdot \frac{\cos^2 x}{\sin^2 x} \\ &= \cos^2 x \end{aligned}$$

in problem 7-24 verify the identities.

$$7. (1 - \sin \theta)(1 + \sin \theta) = \theta$$

Solution:

$$\begin{aligned} L.H.S &= (1 - \sin \theta)(1 + \sin \theta) \\ &= 1 - \sin^2 \theta \\ &= \cos^2 \theta \\ &= R.H.S \end{aligned}$$

$$8. \frac{\sin \theta + \cos \theta}{\cos \theta} = 1 + \tan \theta$$

Solution:

$$\begin{aligned} L.H.S &= \frac{\sin \theta + \cos \theta}{\cos \theta} \\ &= \frac{\sin \theta}{\cos \theta} + \frac{\cos \theta}{\cos \theta} \\ &= \tan \theta + 1 \end{aligned}$$

$$= R.H.S$$

$$9. (\tan\theta + \cot\theta)\tan\theta = \sec^2\theta$$

Solution:

$$\begin{aligned} L.H.S &= (\tan\theta + \cot\theta)\tan\theta \\ &= \left(\frac{\sin\theta}{\cos\theta} + \frac{\cos\theta}{\sin\theta}\right)\frac{\sin\theta}{\cos\theta} \\ &= \left(\frac{\sin^2\theta + \cos^2\theta}{\sin\theta\cos\theta}\right)\frac{\sin\theta}{\cos\theta} \\ &= \left(\frac{1}{\sin\theta\cos\theta}\right)\frac{\sin\theta}{\cos\theta} \\ &= \frac{1}{\cos^2\theta} \\ &= \sec^2\theta \end{aligned}$$

$$10. (\cot\theta + \operatorname{cosec}\theta)(\tan\theta - \sin\theta) = \sec\theta - \cos\theta$$

Solution:

$$\begin{aligned} L.H.S &= (\cot\theta + \operatorname{cosec}\theta)(\tan\theta - \sin\theta) \\ &= \left(\frac{\cos\theta}{\sin\theta} + \frac{1}{\sin\theta}\right)\left(\frac{\sin\theta}{\cos\theta} - \sin\theta\right) \\ &= \left(\frac{\cos\theta + 1}{\sin\theta}\right)\left(\frac{\sin\theta - \sin\theta\cos\theta}{\cos\theta}\right) \\ &= \left(\frac{1 + \cos\theta}{\sin\theta}\right)\left(\frac{\sin\theta(1 - \cos\theta)}{\cos\theta}\right) \\ &= (1 + \cos\theta)\frac{(1 - \cos\theta)}{\cos\theta} \\ &= \frac{1 - \cos^2\theta}{\cos\theta} \\ &= \frac{1}{\cos\theta} - \frac{\cos^2\theta}{\cos\theta} \\ &= \sec\theta - \cos\theta \\ &= R.H.S \end{aligned}$$

$$11. \frac{\sin\theta + \cos\theta}{\tan^2\theta - 1} = \frac{\cos^2\theta}{\sin\theta - \cos\theta}$$

Solution:

$$\begin{aligned} L.H.S &= \frac{\sin\theta + \cos\theta}{\tan^2\theta - 1} \\ &= \frac{\sin\theta + \cos\theta}{\frac{\sin^2\theta}{\cos^2\theta} - 1} \\ &= \frac{\sin\theta + \cos\theta}{\frac{\sin^2\theta - \cos^2\theta}{\cos^2\theta}} \\ &= \frac{\sin\theta + \cos\theta}{\sin^2\theta - \cos^2\theta} \times \cos^2\theta \\ &= \frac{(\sin\theta + \cos\theta)(\sin\theta - \cos\theta)}{1} \times \cos^2\theta \\ &= \frac{1}{\sin\theta - \cos\theta} \times \cos^2\theta \\ &= \frac{\cos^2\theta}{\sin\theta - \cos\theta} \\ &= R.H.S \end{aligned}$$

$$12. \frac{\cos^2\theta}{\sin\theta} + \sin\theta = \operatorname{cosec}\theta$$

Solution:

$$L.H.S = \frac{\cos^2\theta}{\sin\theta} + \sin\theta$$

$$\begin{aligned} &= \frac{\cos^2\theta + \sin^2\theta}{\sin\theta} \\ &= \frac{1}{\sin\theta} = \operatorname{cosec}\theta \end{aligned}$$

$$13. \sec\theta - \cos\theta = \tan\theta\sin\theta$$

Solution:

$$\begin{aligned} L.H.S &= \sec\theta - \cos\theta \\ &= \frac{1}{\cos\theta} - \cos\theta \\ &= \frac{1 - \cos^2\theta}{\cos\theta} \\ &= \frac{\sin^2\theta}{\cos\theta} \\ &= \frac{\sin\theta}{\cos\theta} \times \sin\theta \\ &= \tan\theta\sin\theta \end{aligned}$$

$$14. \frac{\sin^2\theta}{\cos\theta} + \cos\theta = \sec\theta$$

Solution:

$$\begin{aligned} L.H.S &= \frac{\sin^2\theta}{\cos\theta} + \cos\theta \\ &= \frac{\sin^2\theta + \cos^2\theta}{\cos\theta} \\ &= \frac{1}{\cos\theta} \\ &= \sec\theta \end{aligned}$$

$$15. \tan\theta + \cot\theta = \sec\theta\operatorname{cosec}\theta$$

Solution:

$$\begin{aligned} L.H.S &= \tan\theta + \cot\theta \\ &= \frac{\sin\theta}{\cos\theta} + \frac{\cos\theta}{\sin\theta} \\ &= \frac{\sin^2\theta + \cos^2\theta}{\cos\theta\sin\theta} \\ &= \frac{1}{\cos\theta\sin\theta} \\ &= \frac{1}{\sin\theta} \times \frac{1}{\cos\theta} \\ &= \sec\theta\operatorname{cosec}\theta \end{aligned}$$

$$16. (\tan\theta + \cot\theta)(\cos\theta + \sin\theta) = \sec\theta + \operatorname{cosec}\theta$$

Solution:

$$\begin{aligned} L.H.S &= (\tan\theta + \cot\theta)(\cos\theta + \sin\theta) \\ &= \left(\frac{\sin\theta}{\cos\theta} + \frac{\cos\theta}{\sin\theta}\right)(\cos\theta + \sin\theta) \\ &= \left(\frac{\sin^2\theta + \cos^2\theta}{\cos\theta\sin\theta}\right)(\cos\theta + \sin\theta) \\ &= \left(\frac{1}{\cos\theta\sin\theta}\right)(\cos\theta + \sin\theta) \\ &= \frac{\cos\theta}{\cos\theta\sin\theta} + \frac{\sin\theta}{\cos\theta\sin\theta} \\ &= \frac{1}{\sin\theta} + \frac{1}{\cos\theta} \\ &= \operatorname{cosec}\theta + \sec\theta \\ &= R.H.S \end{aligned}$$

$$17. \sin\theta(\tan\theta + \cot\theta) = \sec\theta$$

Solution:

$$\begin{aligned}
 L.H.S &= \sin\theta(\tan\theta + \cot\theta) \\
 &= \sin\theta \left( \frac{\sin\theta}{\cos\theta} + \frac{\cos\theta}{\sin\theta} \right) \\
 &= \left( \frac{\sin^2\theta + \cos^2\theta}{\cos\theta\sin\theta} \right) \sin\theta \\
 &= \left( \frac{1}{\cos\theta\sin\theta} \right) \sin\theta \\
 &= \frac{1}{\cos\theta} \\
 &= \sec\theta
 \end{aligned}$$

$$18. \frac{1+\cos\theta}{\sin\theta} + \frac{\sin\theta}{1+\cos\theta} = 2\operatorname{cosec}\theta$$

Solution:

$$\begin{aligned}
 L.H.S &= \frac{1+\cos\theta}{\sin\theta} + \frac{\sin\theta}{1+\cos\theta} \\
 &= \frac{(1+\cos\theta)^2 + \sin^2\theta}{\sin\theta(1+\cos\theta)} \\
 &= \frac{(1+2\cos\theta+\cos^2\theta+\sin^2\theta)}{\sin\theta(1+\cos\theta)} \\
 &= \frac{1+2\cos\theta+1}{\sin\theta(1+\cos\theta)} \\
 &= \frac{2+2\cos\theta}{\sin\theta(1+\cos\theta)} \\
 &= \frac{2(1+\cos\theta)}{\sin\theta(1+\cos\theta)} \\
 &= \frac{2}{\sin\theta}
 \end{aligned}$$

$$= 2\operatorname{cosec}\theta = R.H.S$$

$$19. \frac{1}{1-\cos\theta} + \frac{1}{1+\cos\theta} = 2\operatorname{cosec}^2\theta$$

Solution:

$$\begin{aligned}
 L.H.S &= \frac{1}{1-\cos\theta} + \frac{1}{1+\cos\theta} \\
 &= \frac{1+\cos\theta+1-\cos\theta}{(1-\cos\theta)(1+\cos\theta)} \\
 &= \frac{2}{1-\cos^2\theta} \\
 &= \frac{2}{\sin^2\theta} \\
 &= 2\operatorname{cosec}^2\theta \\
 &= R.H.S
 \end{aligned}$$

$$20. \frac{1+\sin\theta}{1-\sin\theta} - \frac{1-\sin\theta}{1+\sin\theta} = 4\tan\theta\sec\theta$$

Solution:

$$\begin{aligned}
 L.H.S &= \frac{1+\sin\theta}{1-\sin\theta} - \frac{1-\sin\theta}{1+\sin\theta} \\
 &= \frac{(1+\sin\theta)^2 - (1-\sin\theta)^2}{(1-\sin\theta)(1+\sin\theta)} \\
 &= \frac{1+2\sin\theta+\sin^2\theta-1+2\sin\theta-\sin^2\theta}{1-\sin^2\theta} \\
 &= \frac{4\sin\theta}{\cos^2\theta} \\
 &= \frac{4\sin\theta}{\cos\theta} \times \frac{1}{\cos\theta} \\
 &= 4\tan\theta\sec\theta
 \end{aligned}$$

$$21. \sin^3\theta = \sin\theta - \sin\theta\cos^2\theta$$

Solution:

$$\begin{aligned}
 R.H.S &= \sin\theta - \sin\theta\cos^2\theta \\
 &= \sin\theta(1-\cos^2\theta) \\
 &= \sin\theta(\sin^2\theta) \\
 &= \sin^3\theta \\
 &= L.H.S
 \end{aligned}$$

$$22. \cos^4\theta - \sin^4\theta = \cos^2\theta - \sin^2\theta$$

Solution:

$$\begin{aligned}
 L.H.S &= \cos^4\theta - \sin^4\theta \\
 &= (\cos^2\theta)^2 - (\sin^2\theta)^2 \\
 &= (\cos^2\theta - \sin^2\theta)(\cos^2\theta + \sin^2\theta) \\
 &= (\cos^2\theta - \sin^2\theta)(1) \\
 &= R.H.S
 \end{aligned}$$

$$23. \sqrt{\frac{1+\cos\theta}{1-\sin\theta}} = \frac{\sin\theta}{1-\cos\theta}$$

$$L.H.S = \sqrt{\frac{1+\cos\theta}{1-\sin\theta}}$$

$$= \sqrt{\frac{(1+\cos\theta)(1-\cos\theta)}{(1-\cos\theta)(1-\cos\theta)}}$$

$$= \sqrt{\frac{1-\cos^2\theta}{(1-\cos\theta)^2}}$$

$$= \sqrt{\frac{\sin^2\theta}{(1-\cos\theta)^2}}$$

$$= \frac{\sin\theta}{1-\cos\theta} = R.H.S$$

$$24. \sqrt{\frac{\sec\theta+1}{\sec\theta-1}} = \frac{\sec\theta+1}{\tan\theta}$$

Solution:

$$= \sqrt{\frac{\sec\theta+1}{\sec\theta-1}}$$

$$= \sqrt{\frac{(\sec\theta+1)(\sec\theta+1)}{(\sec\theta-1)(\sec\theta+1)}}$$

$$= \sqrt{\frac{(\sec\theta+1)^2}{\sec^2\theta-1}}$$

$$= \sqrt{\frac{(\sec\theta+1)^2}{\tan^2\theta}}$$

$$R.H.S$$

**Question No.2** A tree casts a 40 meter shadow when the angle of elevation of the sun is  $25^\circ$ . Find the height of the tree.

**Solution:**

From the figure

Height of tree =  $m\overline{AC} = ?$

Length of shadow =  $m\overline{BC} = 40m$

Angle of Elevation =  $\theta = 25^\circ$

Angle of fact that

$$\tan \theta = \frac{m\overline{AC}}{m\overline{BC}}$$

$$\tan \theta = \frac{m\overline{AC}}{40}$$

$$m\overline{AC} = 40 \times \tan 25^\circ$$

$$m\overline{AC} = 18.652m$$

So, height of tree is 18.652 m

**Question No.3.** A 20 feet long ladder is leaning against a wall. The bottom of the wall is 5 feet from the ladder. Find the acute angle (angle of elevation) the ladder makes with the ground.

**Solution:**

from the figure

Length of ladder =  $m\overline{AB} = 20\text{ feet}$

Distance of ladder from the wall =  $m\overline{BC} = 5\text{ feet}$

Angle of elevation =  $\theta = ?$

Using the fact that

$$\cos \theta = \frac{m\overline{BC}}{m\overline{AB}}$$

$$\cos \theta = \frac{5\text{ft.}}{20\text{ft.}}$$

$$\cos \theta = 0.25$$

$$\theta = \cos^{-1} 0.25$$

$$\theta = 75.5225^\circ$$

$$\theta = 75.5^\circ$$

$$\text{or } \theta = 75^\circ 30'$$

So, angle of elevation is  $75^\circ 30'$

## Exercise 7.5

**Question No.1** Find the angle of elevation of the sun if a 6 feet man casts a 3.5 feet shadow.

**Solution:**

From figure we have

$$\tan \theta = \frac{AB}{BC}$$

$$\tan \theta = \frac{6}{3.5}$$

$$\tan \theta = 1.714$$

$$\theta = \tan^{-1}(1.7143)$$

$$\theta = 59.7437^\circ$$

$$\theta = 59^\circ 44' 37''$$

**Question No.4** The base of rectangular is 25 feet and the height of rectangular is 13 feet. Find the angle that diagram of the rectangular makes with the base.

**Solution:**

From the figure

Base of rectangular =  $m\overline{BC} = 25\text{feet}$

Height of rectangular =  $m\overline{BC} = 13\text{feet}$

Diagonal  $\overline{AC}$  is taken

Angle between diagonal and base =  $\theta$

Using the fact that

$$\tan\theta = \frac{m\overline{BC}}{m\overline{AB}}$$

$$\tan\theta = \frac{13}{25}$$

$$\theta = \tan^{-1} \frac{13}{25}$$

$$\theta = 27.4744$$

$$\theta = 27.47^\circ$$

So, angle between diagonal and base is  $27.47^\circ$

**Question No.5** A rocket is launched and climbs at a constant angle of  $80^\circ$ . Find the altitude of the rocket after it travels 5000 meter.

**Solution:**

From the figure

Distance travelled by rocket =  $m\overline{AB} = 5000\text{m}$

Altitude of rocket =  $m\overline{AC} = ?$

Angle of elevation =  $\theta = 80^\circ$

Using

$$\sin\theta = \frac{m\overline{AC}}{m\overline{AB}}$$

$$\sin 80^\circ = \frac{m\overline{AC}}{5000}$$

$$m\overline{AC} = 5000 \times \sin 80^\circ$$

$$m\overline{AC} = 4924.04\text{m}$$

**Question No.6** An aero plane pilot flying at an altitude of 4000m wishes to make an approaches to an airport at an angle of  $50^\circ$  with the plane be when the pilot begins to descend?

**Solution:**

From the figure

Altitude of aero plane =  $m\overline{AC} = 4000\text{m}$

Distance of plane from airport =  $m\overline{BC} = ?$

Angle of depression =  $50^\circ$

As the altimeter angles of parallel lines are equal, so angle

$$\theta = 50^\circ$$

Using the fact that

$$\tan\theta = \frac{m\overline{AC}}{m\overline{BC}}$$

$$\tan 50^\circ = \frac{4000\text{m}}{m\overline{BC}}$$

$$m\overline{BC} = \frac{4000\text{m}}{\tan 50^\circ}$$

$$m\overline{BC} = 3335.64\text{m}$$

So, the distance of aero plane from airport is 3335.64m

**Question No.7** A guy wire (supporting wire) runs from the middle of a utility pole to ground. The wire makes an angle of  $78.2^\circ$  with the ground and touch the ground 3 meters from the base of the pole. Find the height of the pole.

**Solution:**

From the figure

Height of pole =  $m\overline{CD} = ?$

Distance of wire from the base of the pole

$$= m\overline{BC} = 3\text{m}$$

Angle of elevation =  $\theta = 78.2^\circ$

As the wire is attached with the pole at its middle point A so first we find  $m\overline{AC}$

Using the fact that

$$\tan \theta = \frac{m\overline{AC}}{m\overline{BC}}$$

$$\tan 78.2^\circ = \frac{m\overline{AC}}{3}$$

$$m\overline{AC} = 3m \times \tan 78.2^\circ$$

$$m\overline{AC} = 14.36m$$

So, Height of pole is  $m\overline{DC} = 2(m\overline{AC})$

$$= 2 \times 14.36m$$

$$= 28.72m$$

**Question No.8** A road is inclined at an angle  $5.7^\circ$  suppose that we drive 2 miles up this road starting from sea level. How high above sea level are we?

**Solution:**

**From the figure**

Distance covered on road  $= m\overline{AB} = 2 \text{ miles}$

**Angle of inclination**  $= \theta = 5.7^\circ$

Height from sea level  $= m\overline{AC} = ?$

**Using the fact that,**

$$\sin \theta = \frac{m\overline{AC}}{m\overline{AB}}$$

$$\sin 5.7^\circ = \frac{m\overline{AC}}{2}$$

$$m\overline{AC} = 2 \times \sin 5.7^\circ$$

$$m\overline{AC} = 0.199 \text{ mile}$$

Hence, we are at height of 0.199 mile from the sea level.

**Question No.9** A television antenna of 8 feet height is point on the top of a house. From a point on the ground the angle of elevations to the top of the house is  $17^\circ$

And the angle of elevation to the top of antenna is  $21.8^\circ$ . find the height of the house.

**Solution:**

**From the figure**

**Distance of point from house**  $m\overline{BC} = x$

**Height of house**  $= m\overline{AC} = h = ?$

Height of antenna  $= m\overline{AD} = 8 \text{ feet}$

Angle of elevation of top of house  $= 17^\circ$

Angle of elevation of top of antenna  $= 21.8^\circ$

In right angled  $\triangle ABC$

$$\tan 17^\circ = \frac{m\overline{AC}}{m\overline{BC}}$$

$$\tan 17^\circ = \frac{h}{x}$$

$$x = \frac{1}{\tan 17^\circ} \times h$$

$$x = 3.271 \times h \rightarrow (i)$$

Now in right angle  $\triangle DBC$

$$\tan 21.8^\circ = \frac{m\overline{CD}}{m\overline{BC}}$$

$$\tan 21.8^\circ = \frac{m\overline{AD} + m\overline{AC}}{m\overline{BC}}$$

$$\tan 21.8^\circ = \frac{8 + h}{x}$$

$$0.40 = \frac{8 + h}{3.271h} \text{ from (i)}$$

$$0.40 \times 3.271h = 8 + h$$

$$1.3084h - h = 8$$

$$(1.3084 - 1)h = 8$$

$$0.3084h = 8$$

$$h = \frac{8}{0.3084}$$

$$h = \frac{8}{0.3084} = 25.94 \text{ feet}$$

**question No.10** from an observation point, the angles of depression of two boats in line with this point are found to  $30^\circ$  and  $45^\circ$  find the distance between the two boats if the point of observation is 4000 feet high.

**Solution:**

**From the figure**

Height of observation point  $= m\overline{AD} = 4000 \text{ feet}$

Distance between boats  $= m\overline{BC} = ?$

Angle of depression of points B and C are

$30^\circ$  and  $45^\circ$  respectively from point A.

As the alternate angles of parallel lines are equal, so

$$m\angle B = 30^\circ \text{ and } m\angle C = 45^\circ$$

Now in right angled  $\triangle ACD$

$$\tan 45^\circ = \frac{m\overline{AD}}{m\overline{CD}}$$

$$1 = \frac{4000}{m\overline{CD}}$$

$$m\overline{CD} = 4000 \text{ feet}$$

Now in right angled  $\triangle ACD$

$$\tan 30^\circ = \frac{m\overline{AD}}{m\overline{BD}}$$

$$\frac{1}{\sqrt{3}} = \frac{4000}{m\overline{BC} + m\overline{CD}}$$

$$\frac{1}{\sqrt{3}} = \frac{4000}{m\overline{BC} + 4000}$$

$$m\overline{BC} + 4000 = 4000\sqrt{3}$$

$$m\overline{BC} = 4000\sqrt{3} - 4000$$

$$m\overline{BC} = 6928.20 - 4000$$

$$m\overline{BC} = 2928.20 \text{ feet}$$

So, the distance between boats is 2928.2 feet.

**Question No.11** Two ships, which are in lines with the base of a vertical cliff are 120 meters apart. The angles of depression from the top of the cliff to the ship are  $30^\circ$  and  $45^\circ$  as shown in the diagram.

(a) Calculate the distance BC

(b) Calculate the height CD of the cliff.

**Solution:**

From the figure

Height of cliff =  $\overline{CD} = h = ?$

**Distance** =  $\overline{BC} = x = ?$

**Distance between boats** =  $\overline{AB} = 120m$

Angles of depression from point D to point A and B are  $30^\circ$  and  $45^\circ$  respectively.

As the altitude angles of parallel lines are equal, so  $m\angle A = 30^\circ$  and  $m\angle B = 45^\circ$

In right angled  $\triangle BCD$

$$\tan 45^\circ = \frac{m\overline{CD}}{m\overline{BC}}$$

$$1 = \frac{h}{x}$$

$$x = h \rightarrow (i)$$

Now in right angled  $\triangle ACD$

$$\tan 30^\circ = \frac{m\overline{CD}}{m\overline{AC}}$$

$$\frac{1}{\sqrt{3}} = \frac{h}{m\overline{BC} + m\overline{BC}}$$

$$\frac{1}{\sqrt{3}} = \frac{h}{120 + x}$$

$$120 + x = \sqrt{3}h$$

$$120 + h = \sqrt{3}h$$

$$120 = \sqrt{3}h - h$$

$$120 = h(\sqrt{3} - 1)$$

$$120 = h(1.7321 - 1)$$

$$120 = (0.7321h)$$

$$\frac{120}{0.7321} = h$$

$$h = 163.91m$$

As  $x = h$ , so

$$x = 163.91m \text{ or } 164m$$

Height of cliff =  $m\overline{CD} = 164m$

**Question No.12** Suppose that we are standing on a bridge 30 meter above a river watching a log (piece of wood) floating towards us. If the angle with the horizontal to the front of the log is  $16.7^\circ$  and angle with the horizontal to the back of the log is  $14^\circ$ , how long is the log?

**Solution:**

Height of the observer position =  $m\overline{OC} = 30m$

Length of log wood =  $m\overline{AB} = x = ?$

Angles of depression from point O of the points A and B are  $14^\circ$  and  $16.7^\circ$  respectively

In right angled  $\triangle OBC$

$$\tan 16.7^\circ = \frac{m\overline{OC}}{m\overline{BC}}$$

$$0.30 = \frac{30}{m\overline{BC}}$$

$$m\overline{BC} = \frac{30}{0.30}$$

$$m\overline{BC} = 100m$$

Now in right angled  $\triangle OAC$

$$\tan 14^\circ = \frac{m\overline{OC}}{m\overline{AC}}$$

$$0.249 = \frac{30}{m\overline{AB} + m\overline{BC}}$$

$$0.249 = \frac{30}{(x + 100)}$$

$$0.249(x + 100) = 30$$

$$x + 100 = \frac{30}{0.249}$$

$$x + 100 = 120.482$$

$$x = 120.482 - 100$$

$$x = 20.482m$$

So the length of log is 20.48222m.
